Practical Exam: Object-Oriented Programming in Java

Exam Guidelines

- Time Limit: 60 minutes
- Language: Java
- Instructions: Create a folder “YourLastname+PracticalExamC”. Implement the required classes according to the specifications below. Save your file using the main class name provided in each set.

Office Location & Final Address

Objectives

Demonstrate understanding of inheritance, method overriding, constructor chaining using `super`, and the use of the `final` keyword to secure methods.

Specifications

1. **Create a superclass** named `Personnel`:
    - Field: `protected String name`
    - Parameterized constructor `Personnel(String name)` that initializes `name`.
    - Method: `public final String getCity()` that returns `"Iloilo City"` (marked `final` so subclasses cannot change the city).
    - Method: `public void displayFloor()` that prints `"Personnel at 2nd floor"`.
2. **Create a subclass** named `Consultant` that extends `Personnel`:
    - Parameterized constructor `Consultant(String name)` that invokes `super(name)`.
    - Override `displayFloor()` to print: `name + " is assigned to 2nd floor section B"`.
    - Method: `public void displayConsultantInfo()` that calls `displayFloor()` and prints `"City: " + getCity()`.
3. **Create the main class** named `PracticalExamC` with a `main` method:
    - Instantiate a `Consultant` object with the name `"Ben"`.
    - Call `displayConsultantInfo()` on the object.

Expected Output:

```
Ben is assigned to 2nd floor section B
City: Iloilo City
```

Grading Rubric (Total: 20 Points)

Criteria	Points	Description
Class & Inheritance Setup	6 pts	Correct usage of class, extends, abstract, or implements.
Constructors & super	5 pts	Proper constructor definitions and correct use of super(...) as the first statement.
Method Implementation	5 pts	Correct method signature, return types, and overriding.
Compilation & Output	4 pts	Program compiles without errors and reproduces the exact expected output.
